Introduction

Biodiversity is a complex network of genetic codes, species, ecosystems, and ecological processes that supports life on Earth and provides human societies with food, pharmaceutical assets, natural resources, and a set of ecological services and spiritual, cultural, and recreational benefits. This immeasurable asset is, nowadays, more than ever at risk due to anthropogenic activities.

The current trends of population growth and consequent urbanization and industrialization have resulted in ecosystems being increasingly subject to numerous pressures - locally, regionally and globally - which threaten its sustainability.

In that sense, companies are increasingly concerned with assessing the future biodiversity concerns in the areas where they operate and in determining the risks and impacts. In recent years, various tools and methodologies have been developed to help companies respond to this challenge.

Galp is currently using the Integrated Biodiversity Assessment Tool (IBAT). IBAT is an Alliance between BirdLife International, United Nations Environment Programme - World Conservation Monitoring Centre, The International Union for Conservation of Nature (IUCN) and Conservation International. This tool is a biodiversity data provider, giving access to global biodiversity datasets and derived data layers including the IUCN Red List of Threatened Species™, the World Database on Protected Areas (WDPA) and the World Database of Key Biodiversity Areas (WDKBA) (IBAT, 2022).

For this report, IBAT was used to intersect and quantify the areas of high biodiversity interest with the location of the Galp's operated sites. This assessment can be interesting as a first approach. However, for the proper management of biodiversity-related risks for each project, IBAT provides other options, with more detailed data information that can be used as a guide scope/ complement for other specific studies (such as Environmental Impact Assessment).

Objective and Scope

Given the importance of preserving biodiversity and the growing expansion of Galp, there is the continuing need to identify protected biodiversity areas and priority conservation areas, linked to the Company's sites.

Thus, with this study, the coverage of Galp sites is analysed in terms of areas of importance for biodiversity and also the number of IUCN species. This document provides a summary of all the information on biodiversity concerning Galp sites, which materializes in a support tool with the indication of sites requiring priority action from the Company.

The scope of this report extends to all locations where Galp operates. From the 478 sites, 28 sites (Service Stations, 27 in Portugal and 1 in Spain) were considered duplicated for this exercise, as they are located in the same geographic area, with similar coordinates and consequently with same results. For future actions, if applicable, the results and actions for the SS located in the same geographic area and considered for this exercise can be adapted for the SS duplicated, respectively.

To minimize Galp's operational impacts on biodiversity, Company Guidelines were developed to establish general biodiversity principles and allow the determination of the sensitivity of the area of influence of Galp's operations. Namely:

- HSSE Specific Requirements in Projects
- Assessment and Management of the Environmental and Social Impacts of Activities, Products, and Services; Galp (2014).
- Good Biodiversity Management Practice Guide. Galp (2012).
- Integrating Biodiversity into Upstream Project Site Selection. Galp (2014).
- Integrating Biodiversity into Environmental and Social Impact Assessments Conducted in Connection with Upstream Projects. Galp (2014).

To carry out this analysis we used the Integrated Biodiversity Assessment Tool for Business (IBAT), created by IBAT Alliance, constituted by BirdLife International, Conservation International, International Union for the Conservation of Nature (IUCN), and the UNEP World Conservation Monitoring Centre (UNEP-WCMC).

In total, 448 sites were analysed according to Galp's activities.

Table 1 - Galp sites considered in the Biodiversity Risk Assessment

Activities	No. of sites
Biofuel units	1
Exploration & Production	3
Renewable Energy Sources	20
Storage Facilities & Terminals	24
Refining	1
Cogeneration Units	2
Commercial B2C	397
Total	448

The list of sites under analysis can be consulted in detail in Annex I as well as the respective coordinates used in the application of the tool.

In this analysis, any area classified in the categories listed above is called, for simplification, an area of high interest for biodiversity. However, this does not mean that areas excluded from this type of classification are not relevant for biodiversity preservation.

It should be noted that the present study intends to analyse only the location of the Galp sites given the presence of areas with high interest for biodiversity. Therefore, it does not substitute the conducting of a detailed assessment of environmental risks and impacts eventually produced by the respective business units of the Company, which is included, for example, in the Environmental Impact Assessment.

Methodology

IBAT is an interactive mapping tool, giving access to global biodiversity datasets and derived data layers including the IUCN Red List of Threatened Species™, the World Database on Protected Areas (WDPA) and the World Database of Key Biodiversity Areas (WDKBA).

In 2022, the tool methodology to compile the data needed was updated, guarantying a more precise, detailed and transparent report.

For this report, IBAT was used to intersect and quantify the areas of high biodiversity interest with the location of the Galp's operated sites.

This report assesses the biodiversity-related features of multiple operational sites. The information presented is based on various products, such as:

- Protected areas (1 km, 10 km and 50 km):
 - UNESCO-MAB Biosphere Reserve
 - IUCN Classified areasv (1 km, 10 km and 50 km):
 - Category Ia
 - Category Ib
 - Category II
 - Category III
 - Category IV
 - Category V
 - Category VI
 - National (protected areas designated or proposed at the national or sub-national level)
 - Natura 2000
 - Marine Protected Area (OSPAR)
 - World Heritage
 - Ramsar Site, Wetland of International Importance
 - Emerald Network
- Key Biodiversity Areas (KBAs) (1 km, 10 km and 50 km):
 - Important Bird and Biodiversity Areas
 - Alliance for Zero Extinction Sites (AZE)
- Critically Endangered, Endangered and Vulnerable IUCN Red List species that are potentially found within a 50 km radius.

In the Glossary, there is a brief description of the characteristics and criteria underlying the classification of the above areas, as well as other terms used in this document.

The analysis of the area covered by sites with the areas of high biodiversity interest, obtained through IBAT, is presented in two different formats: by country and by activities.

The analysis of the biodiversity associated with each site is performed on three different scales: 1 km, within a radius of 10 km, and within a radius of 50 km. The analysis is characterized by the surroundings of the site, considered 1 km radius, for a more detailed reconnaissance of the operated and surrounding areas. As part of this analysis of biodiversity in Galp sites, "close" is considered to be an area located within a radius of 10 km from the site, followed by the analysis of the area covered, within a radius of 50 km. Therefore, closer a site is to an area of importance for biodiversity, the more vulnerable it will be.

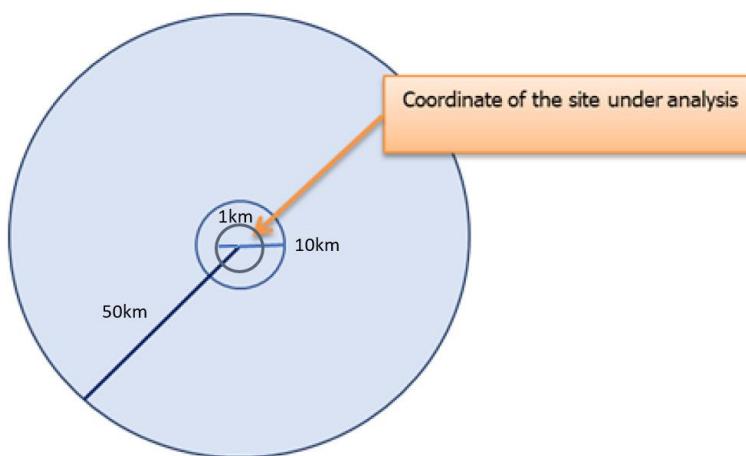

Figure 1 - Analysis approach to the site's surroundings, with the distinction of the radii of 1, 10 and 50 km

Then, in each area of interest for biodiversity, the number of species are identified, being characterized according to their greater or lesser risk of extinction, showing for each site only those classified with threat levels (VU, EN, and CR).

All existing species are classified according to the IUCN criteria, which allow the distinction of classes of risk associated with each species, presented in the table below. In the Glossary, a definition corresponding to each of the concepts presented in the table can be consulted.

Table 2 - Risk extinction levels of the species, according to IUCN classification (Adapted from: IUCN 2014b)

LC	NT	VU	EN	CR	EW	EX
<i>Least Concern</i>	<i>Near Threatened</i>	<i>Vulnerable</i>	<i>Endangered</i>	<i>Critically Endangered</i>	<i>Extinct in the Wild</i>	<i>Extinct</i>
Low risk		Threatened				

Lastly, a synthesis of the results associated with each site according to the areas of activity of Galp is presented:

- Biofuels
- Exploration & Production
- Renewable Energy Sources
- Storage Facilities & Terminals

- Refining
- Cogeneration Units
- Commercial B2C

The main limitations applicable to the analyses carried out in this study, based on information collected in IBAT, were as follows:

- The information provided by IBAT is a result of the monitoring and more recent studies carried out on a global scale, but it does not express the interactions present inter and intra-species, population, or ecosystem;
- The impact arising from the location of the activity concerning the proximity of areas of high biodiversity interest is not reflected in this study;
- This assessment can be interesting as a first approach. However, for the proper management of biodiversity-related risks for each project, IBAT provides other options, with more detailed data information that can be used as a guide scope/ complement for other specific studies (such as Environmental Impact Assessment).

Results and discussion

In this chapter, the results obtained from the application of the IBAT tool are presented and include 448 Galp sites representing the Company's sites, whether owned or holding a stake in 2022. Galp's total operated sites are 476, however, 28 sites (Service Stations, 27 Portugal and 1 Spain) were considered duplicated for this exercise, as they are located in the same geographic area, with similar coordinates and consequently with same results. For future actions, if applicable, the results and actions for the SS located in the same geographic area and considered for this exercise can be adapted for the SS duplicated, respectively.

Considering an overall view and within 1 km radius, 32% of the sites are located in areas of high importance for biodiversity (Protected Areas and KBA). When 50 km buffer distance is applied, almost all sites are located in areas of high importance for biodiversity.

Table 3 - % Sites located in areas of high importance for biodiversity (1 km, 10 km, 50 km)

Sites located in areas of high importance for biodiversity (<1km)	142	31,4%
Sites located in areas of high importance for biodiversity (10 km)	423	94,4%
Sites located in areas of high importance for biodiversity (50 km)	446	99,6%

Looking into these areas of high importance for biodiversity, specifically to UNESCO World Heritage Areas and IUCN Category I-IV protected areas, none of our sites are located in or adjacent to (<1km) to UNESCO protected World Heritage Areas and 25 sites are in or adjacent to IUCN Category I-IV Protected areas. Considering the other buffer distances (10km and 50km) there are sites located in these regions. However, for these cases and depending on the nature of the business and its activities, it is important to analyse case by case the potential biodiversity-related risks and impacts and get more detailed data.

Table 4 - Number of sites located in UNESCO World Heritage Areas

Buffer distance	UNESCO World Heritage Areas
1km	0
10km	1
50km	1

Table 5 - Number of sites located in UCN Category I-IV protected areas

Buffer distance	IUCN Cat Ia	IUCN Cat Ib	IUCN Cat II	IUCN Cat III	IUCN Cat IV
1 km	3	0	6	0	16
10 km	15	14	64	108	177
50 km	68	78	193	292	351

As mentioned, the analysis of the areas covered by Galp sites in areas of high biodiversity interest is presented in two different formats: by countries and by activities.

Note: This approach is not a substitute for the more detailed analysis of the risks and impacts associated with areas of high importance for biodiversity and species with a level of risk of extinction, in the surroundings of Galp sites.

Results by Country

In this subchapter, results are presented according to the country in which the sites are present.

The countries are as follows: Portugal, Spain, Cape Verde, S. Tome and Principe, Guinea-Bissau, Angola, Mozambique, Eswatini and Namibia.

Overall, the sites located in areas of high importance for biodiversity, per country are distributed according with the charts below:

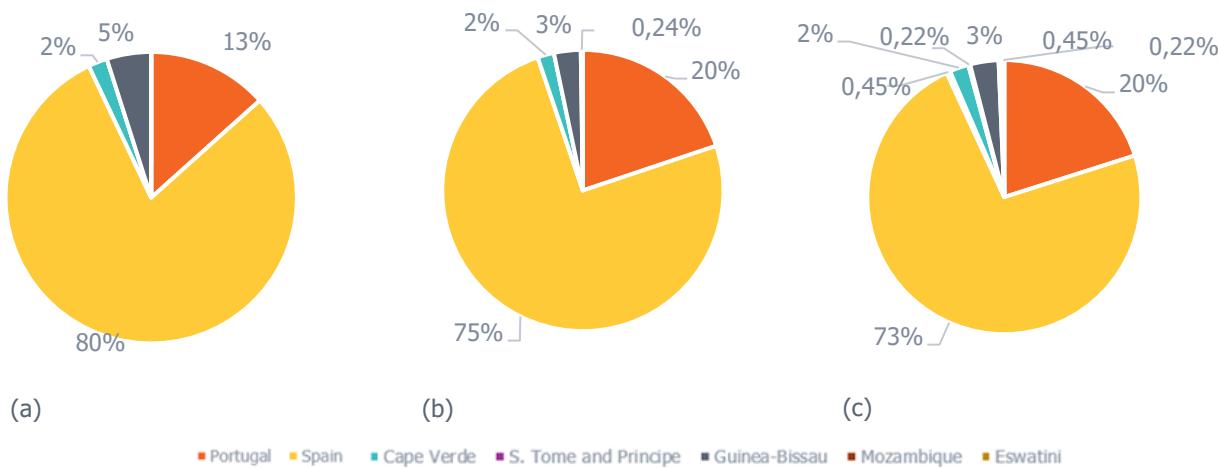

Figure 2 - Sites located in areas of high importance for biodiversity in 1 km (a), 10 km (b) and 50 km (c)

Within 1 km buffer distance, the sites located in areas of high importance for biodiversity are distributed between Spain (80%), Portugal (14%), Guinea-Bissau (5%) and Cape Verde (2%).

In each country section the map of the sites vs biodiversity layers is provided as well as the presentation of the main results. The layers applied for this analysis are the same as areas listed in the methodology chapter:

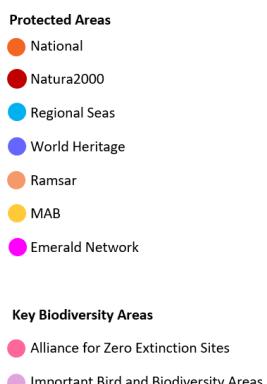

Figure 3 - Layers applied for protected areas and key biodiversity areas

The radius of analysis is: 1 km, within a radius of 10 km, and within a radius of 50 km.

Portugal

The sites covered in this report, for Portugal, are scattered across various activities and were divided into 3 regions, depending on their location: Mainland Portugal, Azores Archipelago and Madeira Archipelago.

Mainland Portugal

The region of Mainland Portugal covers the areas of Cogeneration Units (2), Storage Facilities & Terminals (6), Biofuel Unit (1), Refining (1), Renewable Energy Sources (1) and Commercial B2C (65).

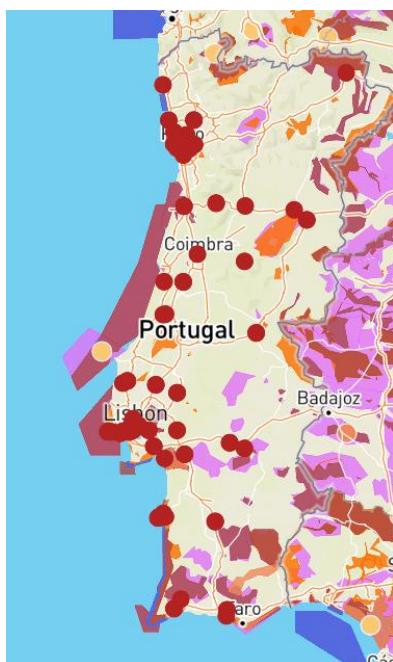

Figure 4 - Location of the Galp sites in Mainland Portugal vs Key Biodiversity Areas and Protected Areas

Mitrena Park is adjacent to areas of importance for biodiversity. The Mitrena Park is adjacent to one Key Biodiversity Area and one Natura 2000 network, the Sado estuary. By analysing the area around the facility, Sado estuary acquires greater prominence with other classifications of areas of interest for biodiversity, such as Protected Area Ramsar.

Enerfuel facility, within 1 km radius, is located in 2 Protected Areas. Within a 10 km radius, Enerfuel Facility and Sines Refinery are located in 9 protected areas (such as National, Regional Seas and Ramsar) and in a Key Biodiversity Area.

All facilities have a relevant group of biodiversity interest areas with a radius of 1 km, 10 km and 50 km.

Table 6 - Number of Classified areas covered by Galp sites in the region of Mainland Portugal

Azores Archipelago

In this region of Portugal, rich in areas of high importance for biodiversity, covers the areas of Storage Facilities & Terminals (5).

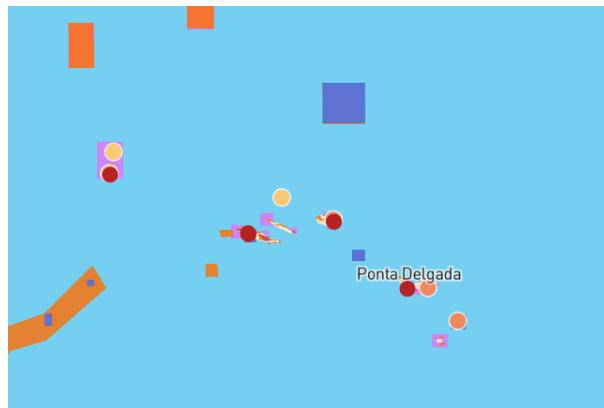

Figure 5 - Location of the Galp sites in Azores Archipelago vs Key Biodiversity Areas and Protected Areas

Analysing the surrounding area of the facility (considering all buffers), all facilities interact with at least one area of high interest for biodiversity.

Table 8 - Number of Classified areas covered by Galp sites in the Azores Archipelago

Madeira Archipelago

On the Madeira Island, Galp holds the operation of the CLCM storage facility, which is located within the limits of an area of high importance for biodiversity: the Madeira Nature Park, classified as Protected Area. Additionally, the sites covered are also Service Stations (6).

Figure 6 - Location of CLCM in Madeira Archipelago vs Key Biodiversity Areas and Protected Areas

Spain

The region of Spain covers the areas of Renewable Energy Sources (18), Storage Facilities & Terminals (2) and Commercial B2C (306).

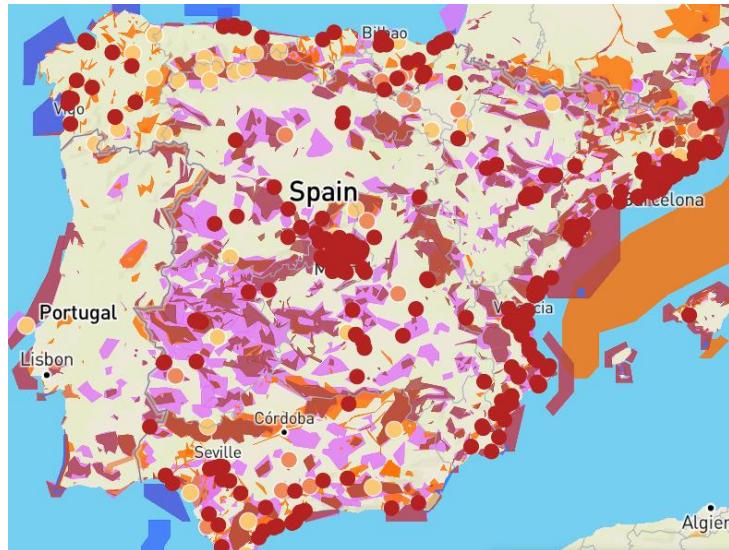

Figure 7 - Location of the Galp's storage facilities in Spain vs Key Biodiversity Areas and Protected Areas

Near the Gijón storage facility, within a radius of 10 km, it has been identified 1 Key Biodiversity Area and 10 Protected Areas (such as regional seas). Surrounding area, the Valencia storage facility, within a radius of 1 km there is one area classified as Protected Area or Key Biodiversity Area. Within a radius of 10 km, there are several Protected Areas (5, such as National and Ramsar) and 1 Key Biodiversity Area.

Besides the storage facilities, in Spain there are renewable energy production sites (solar). According to the analysis within a 1 km radius, none of these listed sites are located in areas of high biodiversity interest, except the RNW Logro, with 3 Protected Areas (such as National and Ramsar).

Considering an overall analysis, within a radius of 50 km, there are several Protected Areas, Key Biodiversity Area, Natura 2000 network, and Ramsar areas that surround all solar sites.

Table 12 - Number of Classified areas covered by Galp sites in Spain

Cape Verde

In the Cape Verde Archipelago, Service Stations (7) and Storage Facilities and Terminals (3) are analysed, as presented below. According to the analysis of the sites, it was concluded that SS-Porto Ingles is located within 1 km of a protected area (Ramsar).

Figure 8 - Location of the Galp sites in Cape Verde vs Key Biodiversity Areas and Protected Areas

S. Tome and Principe

Galp has 2 E&P blocks (offshore) located in S. Tome and Principe, more precisely, between S. Tome and Principe Island and the continental coast of Africa. The analysis made allow to conclude that these sites are not located within or near (1 and 10 km) any area of hight interest for biodiversity.

Figure 9 - Location of the Galp sites in S. Tome and Principe vs Key Biodiversity Areas and Protected Areas

Guinea-Bissau

In Guinea-Bissau, 3 fuel storage facilities were analysed and 12 Service Stations, as presented below. The analysis reveals that, within 1km, 1 SS is located in a Protected Area (National and Ramsar), 6 SS and Bolola Depot are located in Key Biodiversity Areas.

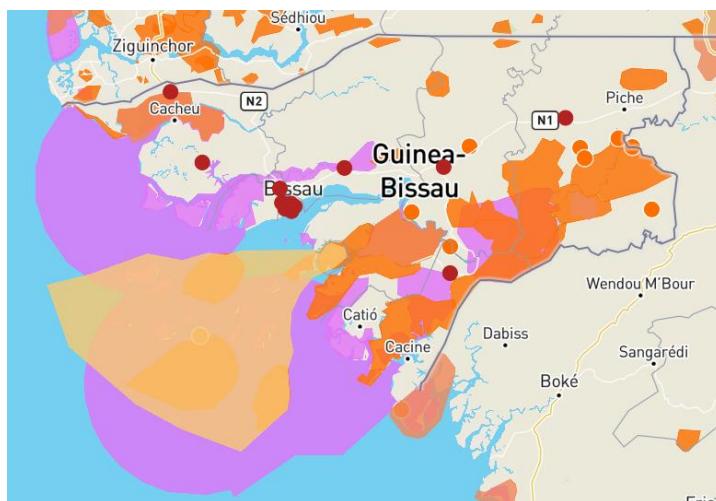

Figure 10 - Location of the Galp sites in Guinea-Bissau vs Key Biodiversity Areas and Protected Areas

Mozambique

In Mozambique, Galp has activities in two storage facilities, Matola LPG and Beira facilities. Within a 1 km radius, none of these facilities are located in areas with high interest for biodiversity.

The Beira facility covers a Protected Area and a Key Biodiversity Area within a 50 km radius of analysis. The Matola LPG facility covers a Key Biodiversity Area within 10km and, within a radius of 50km, 6 National Protected Areas and 9 Key Biodiversity Areas.

Eswatini

The activity of Galp in Eswatini, consists of the Matsapha fuel storage facility. This site is not located in or near (within a 1 km and 10 km radii) areas of high biodiversity interest. However, when analysing more distant surroundings, within a radius of 50 km, 7 National and 1 Ramsar, 1 Ramsar and 5 Key Biodiversity Areas were identified.

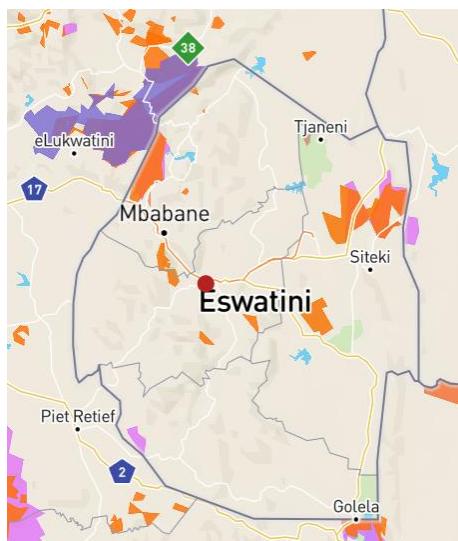

Figure 12 - Location of Galp sites in Eswatini vs Key Biodiversity Areas and Protected Areas

Table 22 - Number of Classified areas covered by Galp sites in Eswatini

Classified areas	1 km	10 km	50 km
Key Biodiversity Areas	0	0	5

Namibia

In Namibia, Galp holds a stake in two E&P blocks, PEL 82 and PEL 83. Given the analysis performed, the site is not located in or near (within a 1, 10 and 50 km radius) any area characterized as high interest for biodiversity, as shown below.

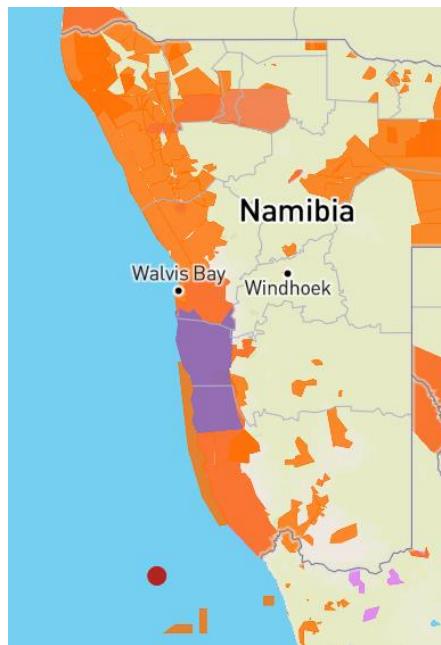

Figure 13 - Location of Galp sites in Namibia vs Key Biodiversity Areas and Protected Areas

Results by activity

In this subchapter the results are presented according to the area of activity to which they are related. The areas of activity are grouped as follows: Biofuel units, Exploration & Production, Renewable Energy Sources, Storage Facilities & Terminals, Refining, Cogeneration Units, and Commercial B2C.

The methodology used for this analysis is the same as the one presented earlier, with the same radius of analysis (within 1 km, within 10 km and within 50 km) for both the areas of high importance for biodiversity and the species that nest in them (50 Km).

Overall, the sites located in areas of high importance for biodiversity, per activity are distributed according with the graphs below:

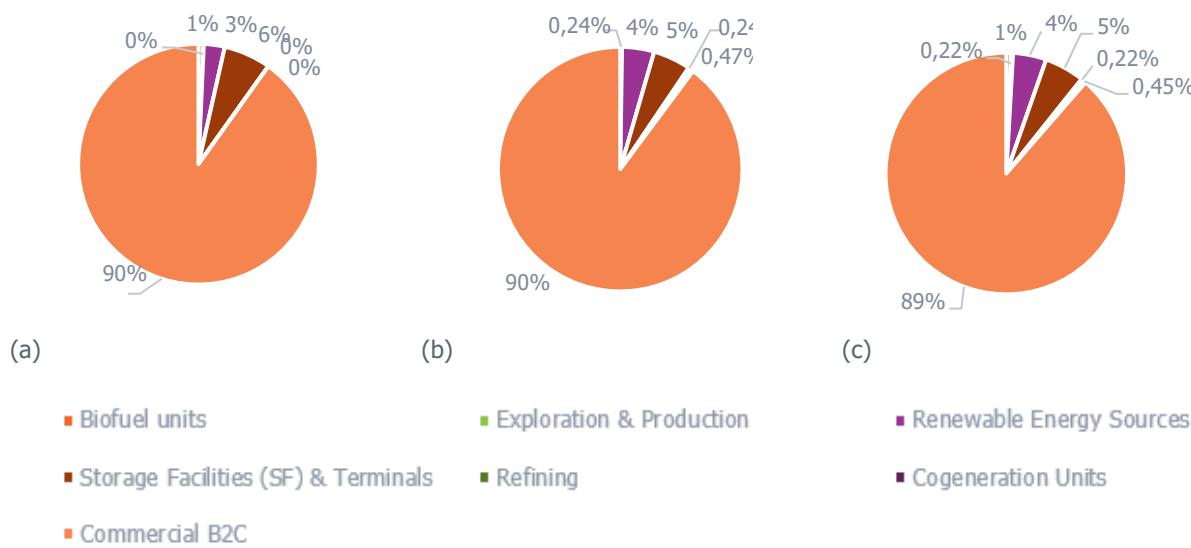

Figure 14 - Sites located in areas of high importance for biodiversity in 1 km (a), 10 km (b) and 50 km (c)

Commercial B2C are the activities with more sites located in areas of high importance for biodiversity, for all three scales of buffer distances.

For a more detailed analysis of the 448 Galp sites, please consult the country-by-country approach, with the maps and detailed descriptions.

Note: This approach is not a substitute for the more detailed analysis of the risks and impacts associated with areas of high importance for biodiversity and species with a level of risk of extinction, in the surroundings of Galp sites.

Biofuels

Within the activity of biofuels, the site analysed is the plant for the production of second generation biofuels - Enerfuel (Portugal).

In the table below is presented the summary of the number of areas with high interest for biodiversity covered by Biofuel activity area.

Enerfuel is adjacent to areas with importance for biodiversity: in a Nature Reserve and in a Site of Community Importance (Habitats Directive).

Table 26 - Areas with biodiversity importance covered by Biofuels sites

Sites	Critically Endangered (CR)	Endangered (EN)	Vulnerable (VU)	Total
Enerfuel	20	32	64	116

In terms of species categorized under the IUCN Red List of Threatened Species, it is important to note that 20 species are critically endangered within a radius of 50 km from the Enerfuel site, in Portugal.

Exploration & Production

In the E&P activity, 3 blocks are analysed, which are located in: Namibia (1), and Sao Tome and Principe (2).

In the table below is presented a summary of the number of areas with high interest for biodiversity covered by 3 sites in the E&P area of activity.

Table 29 - Areas with biodiversity importance covered by E&P sites

Renewable Energy Sources

Looking into Galp's Renewable Energy sources, 19 facilities located in Spain and 2 located in Portugal are analysed.

In the table below, is presented the number of areas of high interest for biodiversity identified for these facilities in the mentioned locations.

Table 32 - Areas with biodiversity importance covered by Renewable Energy Sources

In a 1 km radius, there are four facilities that are located in areas of high interest for biodiversity: RNW – Logro; RNW – Alcazar I, II and II (Spain).

RNW – Logro is adjacent to a Ramsar Site, in a Nature Reserve and in a Site of Community Importance (Habitats Directive).

An analysis of a 10 km radius, reveals that 18 facilities, are located in areas of hight interest for biodiversity. The two remaining facilities that reveal to be located in areas of high interest for biodiversity only when considering the 50 km radius are RNW – FV Ictio Manzanares Solar and RNW – Valdecarro, both located in Spain.

Looking within a radius of 50 km, there are several areas of high interest for biodiversity that are covered.

Storage Facilities & Terminals

The storage facilities and terminals owned by Galp are spread across several geographies: Portugal (13), Spain (2), Cape Verde (3), Guinea-Bissau (3), Mozambique (2), and Eswatini (1). In total there are 24 facilities within this activity, which are analysed below, according to each scale. In the table below it is presented the summary of the number of areas with high interest for biodiversity covered by these facilities.

Table 35 - Areas with biodiversity importance covered by Storage Facilities and Terminals

Classified areas	1 km	10 km	50 km
Key Biodiversity Areas	6	27	151
National	8	57	358
Natura 2000 network	0	0	5
Regional Seas	2	10	17
World Heritage	0	1	1
Ramsar	0	10	36
MAB	0	1	8
Emerald Network	0	0	0

Eight of the 24 Storage Parks and Terminals under analysis are adjacent to areas of importance for biodiversity, six of them located in Mainland Portugal, Madeira and Azores: SF&T – CLCM; SF&T – Flores CL; SF&T – Horta CL; SF&T – Horta GPL; SF&T – Mitrena; SF&T – Nordela LPG; SF&T – Viana do Castelo Terminal.

SF&T – CLCM is adjacent to the Nature Park of Madeira, to a Leisure and Mountain Reserve, a Special Area of Conservation (Habitats Directive), a Special Protection Area (Birds Directive), and to a Key Biodiversity Area. In Azores, SF&T – Flores CL is also adjacent to a Special Protection Area (Birds Directive), to an Habitats or Species Management Protected area and to two Key Biodiversity Areas; SF&T – Horta CL is adjacent to a Protected Landscape, a Nature Reserve, a Resource Management Protected Area, a Special Area of Conservation (Habitats Directive), and to a Marine Protected Area

(OSPAR); SF&T – Horta GPL is adjacent to a Resource Management Protected Area, and to a Marine Protected Area (OSPAR); and SF&T – Nordela LPG is adjacent to a Natural Monument. In Mainland Portugal, SF&T – Mitrena is adjacent to Estuário do Sado, a Special Protection Area (Birds Directive), and to a Key Biodiversity Area; and SF&T - Viana do Castelo is adjacent to a coastal (North Littoral) and terrestrial (Lima River) Sites of Community Importance (Habitats Directive). SF&T – Bolola is adjacent to one Key Biodiversity Area.

Storage Facility & Terminal Horta CL is adjacent to an IUCN Classified area category Ia, V and VI.

Within a radius of 1 km, Storage Facility & Terminals CLCM and Horta GPL are both located in an IUCN Classified area category VI.

Table 36 - IUCN Classified areas covered by Galp sites in Storage Facilities & Terminals

Refining

The Refining activity covers one refinery, in Mainland Portugal (Sines province). In the table below it is presented a summary of the number of areas of high interest for biodiversity covered by this facility associated.

The refinery is not located in areas of high importance for biodiversity. However, analysing the surroundings of the facilities, within a radius of 10 km, we see that it intersects areas of high interest for biodiversity, including two IUCN Protected Areas of IV and V categories (Nature Reserve and Nature Park); one Key Biodiversity Area; one Ramsar; two Sites of Community Importance (Habitats Directive), two Special Protection Areas (Bird Directive) and two Marine Protected Areas (OSPAR).

Table 38 - Areas with biodiversity importance covered by Refining

Classified areas	1 km	10 km	50 km

II	0	0	0
III	0	0	0
IV	0	1	2
V	0	1	1
VI	0	0	0

In terms of species categorized under the IUCN Red List of Threatened Species, Sines Refinery showed a total of 118 endangered species, including 20 critically endangered species.

Table 40 - Number of endangered species found within 50 km of each site for the activity of Refining

Sites	Critically Endangered (CR)	Endangered (EN)	Vulnerable (VU)	Total
Sines Refinery	20	33	65	118

Cogeneration Units

Two facilities located in Mainland Portugal are analysed, corresponding to Agroger and Carriço Co-generation Units.

Both sites are not located in areas of high biodiversity interest. When analysing more distant surroundings, within a radius of 10 km, both facilities intersect with areas of high biodiversity interest, with Cogeneration Unit – Carrico located in two Key Biodiversity Areas.

Table 41 - Areas with biodiversity importance covered by Cogeneration Units

Classified areas	1 km	10 km	50 km
Key Biodiversity Areas	0	2	12

VI	0	0	0

In terms of species categorized under the IUCN Red List of Threatened Species, it is important to note that both sites have similar risks regarding species extension, with 19 critically endangered.

Table 43 - Number of endangered species found within 50 km of each site for the activity of Cogeneration Units

Sites	Critically Endangered (CR)	Endangered (EN)	Vulnerable (VU)	Total
Cogeneration Unit - Agroger	19	32	64	115
Cogeneration Unit - Carrico	19	26	61	106

Commercial B2C

The Commercial B2C activity covers 397 Service Stations, across Portugal, Spain, Cape Verde and Guinea-Bissau. In the table below it is presented a summary of the number of areas of high interest for biodiversity covered by these facilities.

In a 1 km radius, there are 128 Service Stations that are located in areas of high interest for biodiversity, the main category being Key Biodiversity Areas. An analysis within 10 km shows that 380 Service Stations are located in areas of high biodiversity interest.

Table 44 - Areas with biodiversity importance covered by Commercial B2C - Service Stations

Classified areas	1 km	10 km	50 km

III	0	193	3222
IV	13	311	3323
V	31	516	4719
VI	6	88	474

In terms of species categorized under the IUCN Red List of Threatened Species, it is important to note that SS – Caniçal in Portugal has the highest number of species in risk of extinction (195), with 49 critically endangered. For more information about the IUCN Red List of Threatened Species under Commercial B2C Service Stations, please consult Annex II.

Conclusion

Throughout this study 448 Galp sites were analysed, in terms of biodiversity. This analysis assessed Galp sites according to their location in relation to areas of high interest for biodiversity, taking into account areas classified according to the global databases, via the IBAT. Through this analysis, it can be concluded that 142 of the 448 Galp sites, equivalent to 31.7%, are located in or adjacent to areas of high importance for biodiversity (within 1 km radius). **Particularly, in case of UNESCO World Heritage Areas and IUCN Category I-IV protected areas, none of our sites are located in or adjacent to (<1km) UNESCO protected World Heritage Areas and 25 sites (6%) are in or adjacent to IUCN Category I-IV Protected areas.** However, for these cases and depending on the nature of the business and its activities, it is important to analyse case by case the potential biodiversity-related risks and impacts and get more detailed data.

Spain is the country that covers the largest number of IUCN Category I-IV protected areas, explained by the acquisition of the solar power facilities in Spain and the significant number of Service Stations. As expected, it is followed by Portugal with 6 sites, 1 km radius, covering IUCN Category I-IV protected areas.

Considering the analysis of the sites by type of activity, it can be concluded that **Commercial B2C** covers the largest number of areas of biodiversity importance, including IUCN Category I-IV protected areas, in all buffer distances. Considering a radius of 1 km, there are 21 (84%) Service Stations located in areas of high importance for biodiversity, followed by 2 (8%) Storage Facilities and Terminals, 1 (4%) Renewable Energy Sources and 1 (4%) biofuel unit – Enerfuel.

Enerfuel, Logro renewable site, Storage facility Flores CL and several service stations are adjacent to (<1 km radius) IUCN classified area category IV. Also, 2 Service Stations (one in Madeira and one in Madrid) and Storage Facility Horta CL area adjacent to IUCN Classified areas category Ia. There are 6 Service Stations in Spain adjacent to IUCN Classified areas, category II.

In terms of IUCN species analysis, SF&T - CLCM and SS – Caniçal, both located in Portugal, are the facilities with more species categorized under the IUCN Red List of Threatened Species, with a total of 195 species, each. These facilities have also the largest number of critically endangered (CR) species, with 49 species, each.

Regarding the analysis of the surroundings of the sites, within a radius of 10 km, around 84% of Galp sites are located in areas of IUCN Category I-IV protected areas. From this 84%, we highlight Sines Refinery, located in IUCN Category IV protected area.

This analysis helps the identification of the priority action sites in terms of biodiversity, for Galp, as well as the respective areas and classification of protected species in their vicinity. Note that the analyses in this report are indicative and do not replace the detailed analyses of the state of Biodiversity and environmental impacts developed within the scope of activities of Galp that have been - or will come to be – performed.

Glossary

AZE Areas: Alliance for Zero Extinction (AZE) areas are the last existing locations for some of the most endangered species on the planet. AZE areas are distinct areas containing 95% of the known world population of an endangered (EN) or critically endangered species (CR), or that are used in 95% of cases for activities of particular importance for an EN or CR species, for example: reproduction. The loss of an AZE area would result in the extinction of a species in the wild. These areas are effectively the subset of Key Areas of Biodiversity and of Important Bird Areas (IBAs), which absolutely require priority conservation actions. For more information on the classification assigned to the species at risk of extinction, see IUCN Red List of Threatened Species™.

Source: AZE, 2019

Key Areas of Biodiversity: A priority conservation site for a set of species (not just birds), identified by means of quantitative criteria used for the definition of the IBAS. The IBAs have 4 criteria: presence of threatened species worldwide; significant populations of endemic species or with limited distribution; a representative sample of species typically from a specific biome; important congregation of species. This prioritization model was launched by BirdLife International and has been used by other organizations for defining equally important locations for other groups of species, which culminated with the development of the concept of Key Areas of Biodiversity.

Source: KBA, 2019

Area of high interest for biodiversity: any area of biodiversity protection or of priority conservation identified in this report, according to the data provided by the IBAT tool (IUCN protected areas, Key Areas of Biodiversity, National, Ramsar, Natura 2000 network, Regional Seas, MAB, Emerald Network and UNESCO World Heritage).

IUCN protected areas: protected areas, both marine and terrestrial, classified by the IUCN using a comprehensive set of default categories, based on management objectives. These allow the comparison of areas between countries, unlike national designations (for example, national park or forest reserve), which are not internationally standardized.

The characteristics and objectives of IUCN Protected Areas, for each category, are as follows:

- **Category Ia (Strict Nature Reserve):** Strictly protected areas set aside to protect biodiversity and also possibly geological/geomorphological features, where human visitation, use and impacts are strictly controlled and limited to ensure protection of the conservation values.
- **Category Ib (Wilderness Area):** Usually large unmodified or slightly modified areas, retaining their natural character and influence without permanent or significant human habitation, which are protected and managed so as to preserve their natural condition.
- **Category II (National Park):** Large natural or near natural areas set aside to protect large-scale ecological processes, along with the complement of species and ecosystems characteristic of the area, which also provide a foundation for environmentally and culturally compatible, spiritual, scientific, educational, recreational, and visitor opportunities.
- **Category III (Natural Monument or Feature):** Set aside to protect a specific natural monument, which can be a landform, sea mount, submarine cavern, geological feature such

as a cave or even a living feature such as an ancient grove. They are generally quite small protected areas and often have high visitor value.

- **Category IV (Protected area for the management of habitats or species):** Aim to protect particular species or habitats and management reflects this priority.
- **Category V (Protected Landscape/ Seascapes):** Protected area where the interaction of people and nature over time has produced an area of distinct character with significant, ecological, biological, cultural and scenic value: and where safeguarding the integrity of this interaction is vital to protecting and sustaining the area and its associated nature conservation and other values.
- **Category VI (Protected area with sustainable use of natural resources):** Conserve ecosystems and habitats together with associated cultural values and traditional natural resource management systems.

Source: IUCN, 2019

IUCN Red List of Threatened Species™: database with species of animals, plants, fungi and protista in risk of extinction, classified according to the following categories: **Least Concern**, **Near Threatened**, **Vulnerable**, **Endangered**, **Critically Endangered**, **Extinct in the Wild** and **Extinct**.

- **Extinct (EX)** – A *taxon* is Extinct when there is no doubt that the last individual has died. A taxon is presumed Extinct when all exhaustive attempts to find an individual in known and potential habitats at appropriate periods (day, season and year), carried out throughout its historical area of distribution, have failed. The surveys should be made for a period of time appropriate to the lifecycle and biological form of the taxon in question.
- **Extinct in the Wild (EW)** – A *taxon* is extinct in the wild when it is classified as surviving only in cultivation, captivity or as a naturalized population (or populations) outside its previous area of distribution. A taxon is presumed extinct in the wild when all exhaustive attempts to find an individual in known and potential habitats at appropriate periods (day, season and year), carried out throughout its historical area of distribution, have failed. The surveys should be made for a period of time appropriate to the lifecycle and biological form of the taxon in question.
- **Critically Endangered (CR)** - A *taxon* is Critically Endangered when the best available evidence indicates that it meets any of the criteria A to E for Critically Endangered species, whereby it is considered to be facing an extremely high risk of extinction in nature.
- **Endangered (EN)** - A taxon is Endangered when the best available evidence indicates that it meets any of the criteria A to E for Endangered species, whereby it is considered to be facing a very high risk of extinction in nature.

- **Vulnerable (VU)** - taxon is Vulnerable when the best available evidence indicates that it meets any of the criteria A to E for Vulnerable species, whereby it is considered to be facing a high risk of extinction in the wild.
- **Near Threatened (NT)** – A taxon is Near Threatened when, having been evaluated by the criteria, it does not qualify as Critically Endangered, Endangered or Vulnerable, but is however likely to be categorized as endangered in the near future.
- **Least Concern (LC)** – A taxon is Least Concern when it has been assessed by the criteria and does not qualify as any of the categories Critically Endangered, Endangered, Vulnerable or Near Threatened. Broad and plentiful rate of distribution are included in this category.

Source: IUCN, 2019

Protected Area designation: Within IBAT users can filter protected areas data by designation in the following categories:

- **National:** Protected areas designated or proposed at the national or sub-national level
- **Natura 2000:** A European network of protected sites under the European Habitats and Birds Directives, aiming to protect the most valuable and threatened European habitats and species.
- **Regional Seas:** Protected areas established under Regional Seas Conventions such as OSPAR
- **World Heritage:** A landmark or area which is selected by the UNESCO as having cultural, historical, scientific or other form of significance, and is legally protected by international treaties. The sites are judged important to the collective interests of humanity.
- **Ramsar:** Wetlands protected by national governments to fulfil their obligations under the Convention on Wetlands of International Importance (commonly called the Ramsar Convention).
- **MAB:** A global network of sites established by countries and recognized under UNESCO's Man and Biosphere Programme to promote sustainable development based on local community efforts and sound science.
- **Emerald Network:** An ecological network of protected areas comprised of Areas of Special Conservation Interest (ASCI)v designated under Recommendation No. 16 (1989) and Resolution No. 3 (1996) of the Standing Committee to the Bern Convention.
